

WhatsyITC

DEEP DIVE PRODUCT GUIDE

AI powered WhatsApp follow-up operations, explained end to end.

A deeper guide for founders, operators, sales teams, and implementation partners. It explains what the product does, how each workflow behaves, how AI is used, and how teams should operate it daily.

TABLE OF CONTENTS

What this document covers.

This guide is designed for someone who wants to understand the product without reading code or asking the engineering team.

1. Product concept

What WhatsyITC is, who it serves, and what problem it solves.

2. End to end workflow

How data moves from spreadsheet upload to WhatsApp reply and human review.

3. Screen by screen guide

What each admin area does and when users should open it.

4. AI follow-up system

How agents, knowledge, chat history, cadence, and batch control work together.

5. Human review and AI CRM

How urgent leads are surfaced and how managers read batch health.

6. Data and integrations

How Meta WhatsApp, database records, LLMs, embeddings, and templates connect.

7. Operating playbooks

Daily, weekly, demo, and troubleshooting routines.

8. Best practices

How to keep replies accurate, humane, and easy for operators to trust.

The short PDF is best for first introduction. This deep dive is best for internal onboarding, client demos, training, and implementation discussions.

PRODUCT CONCEPT

WhatsyITC turns bulk WhatsApp work into a guided operating system.

Many teams already use WhatsApp for follow-ups. The problem is not sending one message. The problem is managing hundreds of replies, missed leads, errors, and next steps.

INPUT**Batches**

Spreadsheet rows with retailers, phone numbers, invoice or offer details.

CHANNEL**WhatsApp**

Template sends, replies, statuses, and unified chat history.

AUTOMATION**AI Agent**

Context-aware replies grounded in knowledge and recent messages.

FOCUS**Review**

Important phone numbers rise to the human review queue.

The core business value

- Reduce manual follow-up effort after a batch send.
- Keep every phone conversation visible in one place.
- Let AI answer routine questions using business knowledge.
- Escalate only the conversations that need a person.
- Give managers a batch-wise view of what is happening.

The user experience principle

The system should not feel like a hidden automation box. It should feel like a control room where users can see the current state, understand why something happened, and change the next action.

Visible status**Editable plans****Warnings****Human handoff**

END TO END WORKFLOW

From upload to intelligent follow-up.

The product works best when the user follows a clear operating sequence instead of jumping between screens randomly.

SCREEN GUIDE

What each area is for.

The best experience comes from giving each screen a specific job. Operators should know where to start and why.

SCREEN	PRIMARY JOB	WHEN TO USE IT
Dashboard	High-level operational overview and fast navigation.	Start of day or quick health check.
Upload	Import spreadsheet data and create a batch.	Before sending a campaign or follow-up set.
Batches	Inspect batch rows, rename batches, approve, send, and resend.	When preparing or repeating a send.
Chats	Unified phone conversation view for inbound and outbound messages.	When an operator wants the raw WhatsApp thread.
AI Assistant	Configure agent identity, tone, model, and knowledge behavior.	Before testing or assigning AI to a batch.
Knowledge	Add and manage text knowledge used by retrieval.	Whenever AI needs better facts.
AI Follow-ups	Batch-specific AI enablement, recipients, next-message control, and timeline tools.	When managing one batch closely.
Human Review	Priority queue of numbers that need human action.	Daily first stop for operators.
AI CRM	Batch-wise lead summary, priority signals, and AI-generated insights.	Manager view and campaign monitoring.

A simple rule for users: Chats are for the raw thread, Human Review is for urgent action, AI CRM is for batch-level understanding, and AI Follow-ups is for setup and control.

BATCH OPERATIONS

Uploads, approval, templates, resend, and naming.

The batch workflow is the starting point for most customers. It keeps mass messaging controlled and auditable.

Batch preparation

- Upload CSV or XLSX files with phone numbers and business details.
- Validate rows before sending.
- Keep original file name for audit.
- Set a user-friendly batch display name.
- Review duplicates and invalid numbers before enabling AI.

Sending and resending

- Select the right WhatsApp template.
- Use consent dialogs before important sends.
- Track statuses like queued, sent, delivered, failed, and received.
- Resend to a batch when a fresh campaign message is needed.
- Keep errors visible so users can correct credentials or templates.

Duplicate phone handling

If the same phone appears in multiple batches, the user should understand ownership before enabling AI. The system should warn that another batch may already have an AI agent for that phone, then let the user skip that phone or override ownership with the current batch agent.

Warn first**Skip duplicate****Override ownership****Clear batch agent**

AI ASSISTANT

Agent setup and knowledge grounding.

The agent is not just a model. It is a combination of instructions, tone, model selection, knowledge, and batch context.

Agent identity

Users configure a name, tone, and system prompt so responses feel consistent with the business.

Friendly

Human-like

Concise

Model setup

The backend can use Bedrock for chat and OpenAI embeddings for knowledge retrieval when configured.

Bedrock

OpenAI embeddings

Knowledge pickup

Agents can use selected knowledge chunks so replies include product, pricing, policy, and FAQ facts.

KB chunks

Retrieval

Agent playground

Agent
Kaustubh, friendly, active

Knowledge
Products, pricing, policies

Model
Configured in backend environment

What sweets do you have?

We offer gulab jamun, rasgulla, kaju katli, laddoo, and more. What quantity are you looking for?

Can you share price?

Sure. Pricing depends on quantity and delivery date. I can help you pick the best option.

KNOWLEDGE SYSTEM

How long context becomes useful AI memory.

Large documents should not be passed fully into every reply. They should be split, embedded, searched, and only the most relevant parts should be sent to the model.

1

Paste text

Product docs, policy notes, FAQs, price rules.

2

Chunk

Split into useful sections without losing meaning.

3

Embed

Create vectors for semantic search.

4

Retrieve

Find best chunks for the user question.

5

Answer

Reply using chat history plus retrieved facts.

Why this is better than pasting everything

- Lower token usage per message.
- Less irrelevant information in the prompt.
- Better answers when documents are long.
- Knowledge can be updated without changing code.
- Embeddings make similar wording easier to find.

Best content to add

- Product catalog and categories.
- Pricing and discount rules.
- Delivery timelines and service areas.
- Complaint handling policies.
- Common questions and approved answers.

Practical rule: add knowledge in clean sections with descriptive titles. The AI performs best when each chunk answers one clear topic.

AI FOLLOW-UPS

Batch-specific automation with human controls.

AI follow-ups are not global magic. They are controlled per batch so the user knows which agent owns which phone numbers.

Batch control room

- Shows current AI state for the batch.
- Shows the resolved agent and whether AI is enabled.
- Shows tracked recipients and individual control rooms.
- Allows editing or generating the next message.
- Allows manual send-next confirmation before action.

Recipient control room

- Displays the selected phone's latest activity.
- Shows timeline in a dialog to avoid page clutter.
- Shows message plan and AI reasoning signals.
- Lets the user open full conversations.
- Keeps controls near the selected recipient.

Next-message generation

When the user asks AI to generate the next follow-up, the system should use the last 10 to 20 relevant messages, batch objective, agent prompt, and knowledge. The generated message can be edited before being saved or sent.

[Use chat history](#)[Personalized](#)[Editable](#)[Confirm before send](#)

CONVERSATIONS

One phone thread should show everything.

Operators should never wonder why a message appears in one inbox but not another. The phone conversation should be unified across Chats and AI Conversations.

**Inbound**

User messages from WhatsApp webhook are saved and shown in the phone timeline.

Outbound

Template sends, AI replies, and human replies appear in chronological order.

Status

Failed, delivered, received, and handoff signals stay visible to the operator.

Design principle: the user list and thread should sit side by side on desktop. On mobile, the list can collapse after a thread is selected.

HUMAN REVIEW

Urgency queue for phone numbers that need judgment.

The human review queue keeps operators away from noise. It should show distinct phone numbers, why they matter, and what to do next.

Signals that can create urgency

- Customer asked for a person.
- Message delivery failed.
- Complaint or negative sentiment.
- Price question or buying intent.
- Product confusion or unclear requirement.
- Meeting or callback request.

What the queue should show

- Phone number and retailer name.
- Severity and reason label.
- Last message preview.
- Suggested action.
- AI help for summary and draft reply.
- Resolve or snooze controls.

Efficient AI usage

The best approach is to update review signals when the system is already analyzing a conversation for AI reply. That means one LLM call can both prepare a response and update review intelligence. Rule-based signals can still run cheaply for every message.

Rule first**AI when already replying****Cache advice****Avoid duplicate phones**

AI CRM

Batch-wise lead intelligence.

AI CRM is the manager view. It should summarize what is happening across AI-enabled batches without forcing users to open every batch one by one.

INTEGRATIONS AND DATA

How the system connects behind the scenes.

The user experience stays simple because the backend coordinates many moving parts: WhatsApp credentials, message jobs, conversation states, knowledge, LLM providers, and review signals.

RECORD TYPE	WHY IT EXISTS	USER IMPACT
Upload batch	Tracks imported files, display names, status, row counts, and ownership.	Users can understand and manage campaigns.
Message job	Represents outbound sends and inbound synthetic received messages.	Chats can show delivery and reply history.
AI conversation state	Stores phone thread status, handoff, summary, and last activity.	AI inbox can remain stable across refreshes.
AI conversation message	Stores AI, human, user, and tool transcript entries.	Timeline and LLM memory stay inspectable.
Knowledge chunk	Stores business facts and embedding metadata.	AI answers are grounded in current business knowledge.
Human review item	Stores priority reason, severity, summary, and suggested action.	Operators see exactly where human judgment is needed.

OPERATING PLAYBOOKS

How teams should use it day to day.

A product like this succeeds when users have simple habits. These playbooks keep work repeatable.

Daily operator routine

- Open Human Review first.
- Handle critical and high severity numbers.
- Use AI help for concise drafts.
- Open Chats for full context when needed.
- Resolve or snooze after action.

Manager routine

- Open AI CRM.
- Review action required by batch.
- Check buyer replies and cadence.
- Open batch detail for problem batches.
- Update plan or agent if needed.

Admin routine

- Check WhatsApp credentials.
- Refresh templates when needed.
- Improve knowledge base.
- Test agent in playground.
- Watch logs for send or LLM errors.

Troubleshooting mindset

If a reply does not send, check in this order: WhatsApp token, phone number ID, template validity, batch AI enabled state, conversation handoff status, agent enabled state, LLM provider error, and whether the phone belongs to the expected batch.

IMPLEMENTATION BEST PRACTICES

How to keep the experience excellent.

AI products fail when users cannot trust the output or cannot see why something happened. These practices protect trust.

For accurate AI replies

- Keep knowledge chunks clean and topic-specific.
- Test common questions in the agent playground.
- Use product facts instead of generic marketing text.
- Never ask for phone number when the thread already has it.
- Keep replies short, warm, and WhatsApp-native.

For operator trust

- Show send errors directly in the UI.
- Use confirmation dialogs before sends and overrides.
- Keep duplicate-phone warnings clear.
- Make handoff and AI enabled states visible.
- Do not hide messages across different inboxes.

Good first rollout

- Start with one small batch.
- Use one strong agent and one clear knowledge set.
- Test with two verified WhatsApp numbers.
- Simulate common buyer questions.
- Only then scale batch size.

Things to avoid

- Do not enable AI on messy duplicate batches without review.
- Do not rely on AI without knowledge for pricing or policy answers.
- Do not ignore failed sends or 401 credential errors.
- Do not let stale handoff states block active batch AI.
- Do not overload operators with every low-priority message.

DEMO SCRIPT

A strong product walkthrough.

This sequence demonstrates the whole product without overwhelming the viewer.

Best demo questions from the test phone

What is the price?

Can we meet next week?

Do you have this product?

I want to talk to a person

Yes, go ahead

Closing message

WhatsyITC is not only a WhatsApp sender. It is a follow-up operating system where batches, AI replies, human review, and CRM visibility work together so no important customer message is missed.
